

The Comprehensive solution to protect the hearing health of professionals exposed to noise

CAPA

Developed by HearingProTech*

Already mandatory in
Germany and Switzerland!

Control of the Attenuation of Hearing Protection Devices

Are your employees sufficiently protected from noise?
How and why test the effectiveness of your hearing
protection devices?

Government organisations, norms and studies indicate that large gaps can be found between noise reduction measurements made in the laboratory and on the field.

The fact is that noise-protection devices can reduce less noise than their specifications state. The risk of deafness is then not under control.

It is therefore vital to test your hearing protection devices to protect the hearing of your employees who are exposed to noise.

The CAPA solution

CAPA is a system that **quickly and easily tests and certifies the effectiveness of your hearing protection devices**. It lets you know if your devices are compliant and suitable.

It guarantees you and your employees individual hearing protectors that are proven to be effective.

The advantages of CAPA:

- You extend the life of the devices.
- You save money by replacing only the ineffective devices.
